

ARTIFICIAL INTELLIGENCE IN HEALTHCARE

Submitted By: Nanawala Saad

Enrollment No.: 230130107064

Subject: Artificial Intelligence

College: GEC Gandhinagar

Date: 07-07-2026

Introduction

[illegible]

How AI is Used

[illegible]

personalized medicine, robotic surgery, drug discovery, virtual assistants, electronic health records, predictive analytics, wearable devices, ICU monitoring, and hospital management. AI is used in diagnosis, radiology, pathology, personalized medicine, robotic surgery, drug discovery, virtual assistants, electronic health records, predictive analytics, wearable devices, ICU monitoring, and hospital management.

Benefits

[illegible]

Challenges

Major challenges include privacy, cybersecurity, algorithm bias, regulatory approval, high implementation cost, lack of skilled professionals, ethical concerns, transparency, and dependence on quality data. Major challenges include privacy, cybersecurity, algorithm bias, regulatory approval, high implementation cost, lack of skilled professionals, ethical concerns, transparency, and dependence on quality data. Major challenges include privacy, cybersecurity, algorithm bias, regulatory approval, high implementation cost, lack of skilled professionals, ethical concerns, transparency, and dependence on quality data.

Latest Technologies

Future Scope

retinopathy screening, predicting heart disease risk, and assisting doctors in treatment planning. AI has been successfully used for cancer detection from medical images, diabetic retinopathy screening, predicting heart disease risk, and assisting doctors in treatment planning.
